

Yipes Adds CoS

MAY 08, 2007

SAN FRANCISCO -- Yipes Enterprises Services, Inc. today announced the availability of a new Class of Service (CoS) feature that allows customers to prioritize their traffic over Yipes' global Ethernet network to ensure excellent service for converged and other applications that are sensitive to network performance. Yipes is the first facilities-based carrier to offer CoS over a global Virtual Private LAN Service (VPLS)-based network. CoS and other unique features such as industry-leading SLAs make Yipes' fully managed Ethernet service the ideal platform for migrating away from frame relay and ATM.

"Using our CoS feature, available in four classes of service, helps assure our customers they'll receive the service quality they need for their critical performance-sensitive enterprise applications such as VoIP, real-time videoconferencing, and collaboration," said Dr. Kamran Sistanizadeh, chief technology officer and co-founder of Yipes. "CoS is very attractive to national and multinational enterprises because of the increase in internal VoIP deployments and mission-critical intranet applications."

Yipes CoS is suitable for any multi-office organization looking to provide the highest level of service across the WAN. The new Yipes feature ensures high performance of network applications, supports any-to-any connectivity, and is easy to deploy and manage. In addition, Yipes CoS is secure, gives customers more control over their network performance, and is more cost effective than Layer 3 CoS. The combination of CoS, Yipes' global Ethernet VPLS, the industry's strongest SLAs, and the ability to provision service over both copper and fiber, means customers can enjoy high-quality service throughout the Yipes network -- and with a lower total cost of ownership than other network technologies.
